

Suppose I choose to host a session, I will be redirected to a different page where I will need to fill in forms for the event and myself. First, I can optionally fill in the name for the session. If I do not choose a name, the session's name will simply be empty. Then, I must choose a start date for the session. To do so I can click on the input field and a calendar will pop up allowing me to choose a date. The session's timeframe will be one calendar week starting from that day. If I do not choose a date, the web app will default to using tomorrow as the start date. Then, I have to type a location (a city name) that will be used for the session and to find restaurants. This field is required, and I cannot create the session without choosing a location. Next, I will have the option to fill in some personal preferences for myself (refer to personal information story). Lastly, I will have the option to block of time slots (refer to custom calendar restrictions story).

Once I am done providing information, I can click a button to create the session, which will make the session's page and redirect me to it. The session page will display the session's name, a unique session id, and the week the session considers. I can share this id with other people, which they can use to join my session.

The session page will also display all members in a table with their names, email, and a checkbox indicating whether or not they must attend. When I want, I can close the session (refer to the closing a session story).
